## ALIGNMENTS

RESULT 236230 Z36230; 22-FEB-2000 Z36230 standard; cDNA; 1610 BP (first entry)

cDNA encoding a bone marrow secreted protein designated BMS112.

Bone marrow secreted protein; bone marrow stromal cell; cytokine; cell proliferation; cell differentiation; hematopolesis; anaemia; myeloid cell deficiency; lymphoid cell deficiency; myeloid cell; erythroid progenitor cell; colony stimulating factor; granulocyte; monocyte; macrophage; myelo-suppression; megakaryocyte; platelet; platelet disorder; thrombocytopenia; hematopoeitic stem cell; stem cell disorder; aplastic anaemia; bone differentiation; paroxysmal nocturnal hemoglobinuria; bone growth; cartilage; tendon; ligament; nerve; wound healing; tissue repair; burn; incision; ulcer; bone fracture; cartilage damage; artificial joint; ss.

Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                           В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC 236228-49 encode bone marrow secreted proteins of human bone marrow CC stromal cells. The proteins can exhibit cytokine, cell proliferation, or CC cell differentiation activity (either inducing or inhibiting). They can be used to support colony forming cells or factor-dependent cell lines, CC to regulate hematopoiesis, and to treat myeloid or lymphoid cell CC deficiencies. In addition, they may be used to support the growth and CC proliferation of erythroid progenitor cells, and to treat various CC anaemias. They can have colony stimulating factor (CSF) activity and can be used to support the growth and proliferation of myeloid cells such as CC granulocytes, monocytes or macrophages, to prevent or treat myelo-suppression, to support the growth and proliferation or treatment CC megakaryocytes and platelets, thereby allowing prevention or treatment CC and proliferation of hematopoeitic stem cells, either in place of or in CC conjunction with platelet transfusions, to treat stem cell disorders, corepopulate the stem cell compartment after irradiation or chemotherapy. They can be used for growth or differentiation of bone, cartilage, ct tendon, ligament, or nerve tissue, as well as for wound healing and CC tissue repair and replacement, and in the treatment of burns, incisions and ulcers, to induce cartilage and/or bone growth in circumstances where CC bone is not normally formed and thus have an application in healing bone creduction and also in the improved fixation of artificial joints.

                                                                                                                                                                                                                  standard and and and antibo
                                                                                                                                spinal injury, neuronal degeneration, neuromuscular disorders, psychiatric disorders and developmental disorders, cancer, stroke inflammatory disorders. The polynucleoitde is also useful for chrolocalization and for tissue expression studies. The present sequer represents a DNA encoding the human MAGI protein variant.
                                                                                                                                                                                                             The invention relates to human MAGI protein, which is similar to neuroendocrine-specific protein. The MAGI protein can be expressed by standard recombinant methodology. The MAGI polypeptides, polynucleotides and antibodies are useful for treating diseases, including neuropathies,
                                                                                                                                                                                                                                                                                                                            Novel polypeptides related to neuroendocrine-specific proteins and polynucleotides useful for diagnosis of various diseases and for treatment of cancer and neurological disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1561

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   compared to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic aci sequences: X04311-X04410; amino acid sequences W78126-W78225) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 86 polynucleotides, based on the first triangle of the presence of mutations in the new polynucleotides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. x04302) for increasing the stability of the fused protein as

cc secreted, i.e., transmembrane proteins. The proteins of the invention may exhibit one or more activities selected from the following: cytokine cativity; cell proliferation; differentiation; immune modulation; chaematopoiesis regulation; tissue growth activity; activin/inhibin cativity; chemotactic/chemokinetic activity; haemostatic and thrombolytic activity; anti-inflammatory activity; and tumour inhibition cativity. The proteins may be administered to patients as vaccines, and the nucleotides may be used as part of a gene therapy regime. Diseases or conditions that may be treated using the proteins or nucleotides of the invention include autoimmune diseases; genetic disorders; haemophilia; cardiovascular diseases; cancer; bacterial, fungal and viral infections, especially HIV; multiple sclerosis; rheumatoid arthritis; pulmonary inflammaton; Guillain-Barre syndrome; insulin dependent diabetes can mellitus; and allergic reactions such as asthma and anaemia. They may calso be used for treating wounds, burns, ulcers, osteoprosis, contease, Huntington's diseases and amyotrophic lateral sclerosis (ALS). Proteins with activin/inhibin activity may additionally be useful as contraceptives. Nucleic acid sequences of the invention may be used in the invention and proteins of the invention.

```

The invention relates to 40 human secreted proteins (Y94981-Y95020), and cDNA sequences encoding them (A23423-A23462). The secreted prote of the invention include those that are thought to be only partially

secreted proteins only partially

This sequence represents an extended human secreted protein coding sequence of the invention. The secreted proteins can be used in treating or controlling a variety of human conditions. The secreted proteins may act as cytokines or may affect cellular proliferation or differentiation or may act as immune system regulators, heamatopoiesis regulators, tissue growth regulators, regulators of reproductive hormones or cell movement or have chemotactic/chemokinetic, receptor/ligand, anti-inflammatory or tumour inhibition activity. The DNAs can be used in forensic procedures to identify individuals or in diagnostic procedures to identify individuals or in diagnostic procedures to identify sense used in the sense resulting from abnormal expression of the genes corresponding to the extended cDNAs. They are also useful for

                                                                                                                                              PCR, to generate antibodies, and in interaction trap assays. The secreted proteins may also have many biological activities, e.g. cytokine, immunomodulator, haematopoiesis regulating activity, tissue growth activity, activin or inhibin activity, chamotactic or chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, antiinflammatory, cadherin and tumour invasion suppressor activity, and tumour inhibition activity. The proteins can be expressed in vivo from DNA, introduced in gene therapy vectors.

                                                                                                                                                                                                                                                                                 sequence shows homology to neuroendocrine-specific proteins. Novel CDNA clones (see V30916-32) coding for human secreted proteins (see W58580-90) are claimed. These can be used for recombinant production of the secreted proteins for analysis, characterisation, diagnostic or therapeutic use. They can also be used as tissue or mol.wt. markers, for chromosome identification, to identify genetic
                                                                                                                                                                                                                                                                                                                                                                 This cDNA clone, designated BG160_1, codes for a novel human secreted protein (see W58383). It was isolated from a human adult brain cDNA library using methods selective for cDNAs that encode secreted proteins. The clone is deposited in composite clone arcc 98232; an oligonuclectide (see T99722) is designed to isolate the clone from the composite. The predicted AT415_4 amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid encoding secreted protein from human cells - usefie.g. as immunomodulator, antitumour agent, promoters of tissue growth, haemostatic and thrombolytic agents etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        24-OCT-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sclerosis. Also antisense nucleic acids and antagonists of NSPLP can be used to inhibit activity of the NSPLP proteins. Antibodies specific for NSPLP are used for diagnosis and monitoring treatment of diseases associated with NSPLP expression, in usual immunoassays, and to isolate NSPLP from natural sources. The NSPLP proteins, or their fragments can also be used in drug screening to identify NSPLP antagonists. The nuclei acid can be used diagnostically and for monitoring treatment (in hybridisation or amplification assays); to isolate closely related sequences; in gene therapy for both sense and antisense applications (including use of ribozymes) and for mapping the natural genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human neuro-endocrine-specific protein-like proteins - useful for diagnosis, monitoring and treatment of cancer and neuro-degenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein (NSPLP) of the invention. Recombinant cells transformed witi
DNA are used to express the NSPLP proteins, which are used to treat

The MAGI protein can be expressed by standard recombinant methodology. The MAGI polypeptides, polynucleotides and antibodies are useful for treating diseases, including neuropathies, spinal injury, neuronal degeneration, neuromuscular disorders, stroke and inflammatory disorders and developmental disorders, cancer, stroke and inflammatory disorders. The polynucleotide is also useful for chromosome localization and for tissue expression studies. The present sequence represents a DNA encoding the human MAGI protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MAGI protein; neuroendocrine-specific protein; neuropathy; human; spinal injury; neuronal degeneration; neuromuscular disorder; cancer; psychiatric disorder; developmental disorder; inflammatory disorder;

The present sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, haemostatic and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                            Claim

The proteins given represent the signal peptide and an CC N-terminal fragment of a secreted protein. The nucleic acid sequences CC can be used for producing secreted human gene products. They can also CC be used to develop products for diagnosis and therapy. The proteins CC obtained may have cytokine activity, cell proliferation/differentiation CC activity, haematopoiesis regulating activity, chemotactic/ CC chemokinetic activity, haemostatic and thrombolytic activity, receptor/CC ligand activity, anti-inflammatory activity, tumour inhibition activity CC or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for CC obtaining corresponding promoter sequences. The nucleic acids encoding corresponding promoter sequences. The nucleic acids encoding the corresponding promoter sequences.

The polypeptides and polynucleotides encoding them have cytostatic activity and can be used in vaccines and in gene therapy. The polypeptides and polynucleotides encoding them, antigen presenting cells which express the polypeptides, antibodies against the polypeptides and vaccines comprising them can be used for inhibiting the development of prostate cancer in a patient. The polypeptides can be used to generate antibodies or anti-idiotypic antibodies for passive immuno therapy. A portion of the polypucleotides encoding the polypeptides can be used as a probe or to modulate the expression of the polypeptides. A06241 to A06691 and W82000 to Y82020 represent sequences used in the exemplification of the

                                                                                                                                                                                                                                                                                                A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a CDNA library can be harmonical can using methans and proches derived from the GS
                                                                                                       determined (esp. using primers and probes derived sequences) as a means of diagnosing abnormal cell recognising different cell types.

                                                                                                                                                                                                        This invention describes a method for the comparison of gene expression profiles from granulocytes from a test subject and from pathogen-exposed or sterile inflammatory disease granulocytes or quiescent granulocytes. The method is used to detect pathogen exposure or sterile inflammatory disease in a subject and to identify therapeutic agents that modulate expression of a gene in response to a pathogenic infection or to sterile inflammatory disease in a subject. The method tests for global transcriptional response of granulocytes during cell activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection of pathogen exposure or sterile inflammatory disease in subject - by comparing gene expression profiles from granulocytes of the patient and control granulocytes

                                                                                                                                                                                                                                                                                                                                                                                                                          Sequences Z09006-Z09075 are Differentiation Induction Subtraction Hybridization (DISH) sequences, which encode Differentiation-Associated Proteins (DAPs). DAPs are associated with terminal differentiation and growth arrest and the sequences encoding them range from 97-903 base pairs in length. A DAP, a DAP fragment or a DAP polynucleotide may be useful in inhibiting the development of cancer including prostate, breast, lung and colorectal cancer, melanoma, astrocytoma or glioblastoma multiforme. Determining the level of a DAP or its coding sequence, in a tumour sample can be used to determine whether the tumour is malignant. The progression of cancer can be monitored by measuring DAP expression of activity levels over a period of time. An agent that increases expression

                                                                                                                                                                                                                      CC associated proteins which are associated with terminal differentiation CC and cell cycle arrest. The cDNAs, or the proteins they encode, can be CC used in vaccines or other therapeutic compositions to inhibit development CC of cancer, especially prostate, breast, lung and colorectal cancer, CC melanoma, astrocytoma or glioblastoma multiforme. Determination of the CC level of the differentiation-associated protein (especially using a CC monoclonal antibody) is useful for assessing whether a tumour is CC malignant. The progression of a cancer can be monitored by comparing CC levels of a differentiation-associated nucleotide or protein over a CC modulate cell protein can also be used to identify agents that CC modulate cell proliferation and/or differentiation. Differentiation-cc associated protein gene promoters or regulatory elements can be CC operably linked to reporter genes and used in assays to identify agents that modulate expression. An agent that increases expression of such cover a content of the comparing content is useful for inhibiting the development of a cancer.

                                                                            The invention relates to human MAGI protein, which is similar to neuroemdocrine-specific protein. The MAGI protein can be expressed by standard recombinant methodology. The MAGI polypeptides, polynucleotides and antibodies are useful for treating diseases, including neuropathies, spinal injury, neuronal degeneration, neuromuscular disorders, stroke and psychiatric disorders and developmental disorders, cancer, stroke and inflammatory disorders. The polynucleotide is also useful for chromosome localization and for tissue expression studies. The present sequence represents a DNA encoding the human MAGI protein variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel polypeptides related to neuroendocrine-specific proteins and polynucleotides useful for diagnosis of various diseases and for treatment of cancer and neurological disorders -  \frac{1}{2} \int_{-\infty}^{\infty} \frac{1}{2} \left( \frac{

They can have colony stimulating factor (CSF) activity and can CC be used to support the growth and proliferation of myeloid cells such as CC granulocytes, monocytes or macrophages, to prevent or treat CC myelo-suppression, to support the growth and proliferation of comegakaryocytes and platelets, thereby allowing prevention or treatment CC of platelet disorders such as thrombocytopenia, to support the growth CC and proliferation of hematopoeitic stem cells, either in place of or in CC conjunction with platelet transfusions, to treat stem cell disorders, CC such as aplastic anaemia and paroxysmal nocturnal hemoglobinuria, or to CC repopulate the stem cell compartment after irradiation or chemotherapy. CC They can be used for growth or differentiation of bone, cartilage, CC tissue repair and replacement, and in the treatment of burns, inclasions CC and ulcers, to induce cartilage and/or bone growth in circumstances where CC bone is not normally formed and thus have an application in healing bone CC reduction and also in the improved fixation of artificial joints.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Align seg 1/1 to: 236230

The proteins can exhibit cytokine, cell proliferation, or cell differentiation activity (either inducing or inhibiting). They can be used to support colony forming cells or factor-dependent cell lines, to regulate hematopolesis, and to treat myeloid or lymphoid cell deficiencies. In addition, they may be used to support the growth and proliferation of erythroid progenitor cells, and to treat various

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human MAGI protein, which is similar to neuroendocrine-specific protein. The MAGI protein can be expressed by standard recombinant methodology. The MAGI polypeptides, polynucleotides and antibodies are useful for treating diseases, including neuropathies, spinal injury, neuronal degeneration, neuromuscular disorders, psychiatric disorders and developmental disorders, cancer, stroke and inflammatory disorders. The polynucleotide is also useful for chromosome localization and for tissue expression studies. The present sequence represents a DNA encoding the human MAGI protein.

Contractory multiple sclerosis; rhemmatic activity; and tumour inhibition cartivity; chemotactic/chemokinetic activity; and tumour inhibition throughout activity; anti-inflammatory activity; and tumour inhibition activity. The proteins may be administered to patients as vaccines, and the nucleotides may be treated using the proteins or nucleotides of the conditions that may be treated using the proteins or nucleotides of the condition include autoimmune diseases; genetic disorders; haemophilia; cardiovascular diseases; cancer; bacterial, fungal and viral infections, especially HIV; multiple sclerosis; rheumatoid arthritis; pulmonary inflammation; Guillain-Barre syndrome; insulin dependent diabetes concerthritis, periodontal diseases, hizhelmer's disease, Parkinson's caseaserthritis, periodontal diseases, Alzhelmer's disease, Parkinson's contraceptives. Nucleic acid sequences of the invention may be used in chromosome mapping, and as a source of diagnostic primers and probes. The present sequence represents cDNA encoding one of the 40 proteins of the present sequence represents cDNA encoding one of the 40 proteins of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         24 - AUG-1998;

                                                                                                                                                                                                                                                                                                                                                                        The invention relates to 40 human secreted proteins (Y94981-Y95020), and cDNA sequences encoding them (A23423-A23462). The secreted proteins of the invention include those that are thought to be only partially secreted, i.e., transmembrane proteins. The proteins of the invention may exhibit one or more activities selected from the following: cytokine activity; cell proliferation; differentiation; immune modulation;

                                                                                                                                                                                                                                                                                                                                 alignment_scores:
                                                                                                                                                                                             Align seg 1/1
                                                                                                                                                                                                                                                                               Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence encodes a human neuroendocrine-specific protein-like protein (NSPLP) of the invention. Recombinant cells transformed with the DNA are used to express the NSPLP proteins, which are used to treat cancer and neurodegenerative diseases such as amyotrophic lateral sclerosis. Also antisense nucleic acids and antagonists of NSPLP can be used to inhibit activity of the NSPLP proteins. Antibodies specific for NSPLP are used for diagnosis and monitoring treatment of diseases associated with NSPLP expression, in usual immunoassays, and to isolate NSPLP from natural sources. The NSPLP proteins, or their fragments can also be used in drug screening to identify NSPLP antagonists. The nucleic acid can be used diagnostically and for monitoring treatment (in hybridisation or amplification assays); to isolate closely related sequences; in gene therapy for both sense and antisense applications sequences.
                                                                                                                                108

                                                                                                                                                                                                                                                                                               compared to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic acid sequences: X04311-X04410; amino acid sequences W78126-W78225) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 86 polynucleotides, based on which tissues they are most highly expressed in (see X04311 for described
                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. X04302) for increasing the stability of the fused protein as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence of the invention. The secreted proteins can be used in treating or controlling a variety of human conditions. The secreted proteins may act as cytokines or may affect cellular proliferation or differentiation or may act as immune system regulators, haematopoiesis regulators, tissue growth regulators, regulators of reproductive hormones or cell movement or have chemotactic/chemokinetic, receptor/ligand, anti-inflammatory or tumour inhibition activity. The DNAs can be used in forensic procedures to identify individuals or in diagnostic procedures to identify individuals or in diagnostic procedures to identify individuals or in diagnostic procedures to identify corresponding to the extended cDNAs. They are also useful for constructing a high resolution map of the human chromosomes. They can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         118

seq_name: /SIDS6/gcgdata/geneseq/geneseqn/NA1998.DAT:V30920
This cDNA clone, designated BG160_1, codes for a novel human:

secreted protein (see W38383). It was isolated from a human adult

brain cDNA library using methods selective for cDNAs that encode

secreted proteins. The clone is deposited in composite clone

ATCC 98232; an oligonucleotide (see T99725) is designed to isolate

the clone from the composite. The predicted AT415_4 amino acid

sequence shows homology to neuroendocrine-specific proteins. Novel

CDNA clones (see V30916-32) coding for human secreted proteins (see

W38580-90) are claimed. These can be used for recombinant

production of the secreted proteins for analysis, characterisation,

diagnostic or therapeutic use. They can also be used as tissue or

mol.wt. markers, for chromosome identification, to identify genetic

disorders, to isolate new related DNA, as sources of primers for

CR, to generate antibodies, and in interaction trap assays. The

secreted proteins may also have many biological activities, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; beta-amyloid precursor protein; beta-APP; diagnosis; cancer; frameshift mutation; age-related disease; neurodegenerative disorder; Alzheimer's disease; Down's syndrome; myotonic dystrophy; neuronal; Huntington's disease; multiple sclerosis; alcoholic liver disease; diabetes mellitus type II; microtubule associated protein; Tau; Big Tau ubiquitin B; apoliporotein E; MAP2; neurofilament-L; neurofilament-M; neurofilament-M; presentlin I; presentlin II; cellular tumour antigen; glial fibrillary acidic protein; GFAP; p53; semaphorin III; HUPF-1; bcl-2; B-cell leukemia/lymphoma 2 proto-oncogene; HMGP-C; NSP-A; high-mobility graup protices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            disease, Down's syndrome, myotonic dystrophy, Huntington's disease, multiple sclerosis, alcoholic liver disease, diabetes mellitus type II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including better than the control of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Diagnosing disease by detecting frameshift mutations in RNA or corresponding protein mutations - used to diagnose cancer and neurological diseases, particularly Alzheimer's disease, and also for treatment and prevention with specific ribozymes or wild-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Figure 19; 258pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a nucleic acid molecule designated Gene 92 from the human cDNA clone HAUBL57 (deposited as clone ATCC 97887 and ATCC 209043) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. V59502) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 186 novel genes and their fragments (nucleic acid sequences: V59511-V59812; amino acid sequences W74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypuctivities in a sample or by determining the presence of mutations in the new polypuctides, based on which tissues they are most highly expressed in (see V59511 for described inservices).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated human genes and the secreted polypeptide(s) they encode - useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Feng Р,

                                 This sequence represents a nucleic acid molecule design the human cDNA clone HAUBL57 (deposited as clone ATCC 209043) which encodes a secreted human protein. The generate fusion proteins by linking to the gene to a hec portion (e.g. V59502) for increasing the stability protein as compared to the human protein only.
                                                                                                                                                                                                                                                                                                                       WPI; 19:

Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see v59511 for described

CC myelo-suppression, to support the growth and proliferation of
megakaryocytes and platelets, thereby allowing prevention or treatment
CC megakaryocytes and platelets, thereby allowing prevention or treatment
CC of platelet disorders such as thrombocytopenia, to support the growth
CC and proliferation of hematopoeitic stem cells, either in place of or in
CC conjunction with platelet transfusions, to treat stem cell disorders,
CC such as aplastic anaemia and paroxysmal nocturnal hemoglobinuria, or to
CC repopulate the stem cell compartment after irradiation or chemotherapy.
CC They can be used for growth or differentiation of bone, cartilage,
CC tendon, ligament, or nerve tissue, as well as for wound healing and
CC tissue repair and replacement, and in the treatment of burns, incisions
CC and ulcers, to induce cartilage and/or bone growth in circumstances where
CC bone is not normally formed and thus have an application in healing bone
CC fractures and cartilage damage or defects, prophylactic use in fracture
CC reduction and also in the improved fixation of artificial joints.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Align seg 1/1 to:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            z36228-49 encode bone marrow secreted proteins of human bone marrow stromal cells. The proteins can exhibit cytokine, cell proliferation, or cell differentiation activity (either inducing or inhibiting). They can be used to support colony forming cells or factor-dependent cell lines, to regulate hematopoiesis, and to treat myeloid or lymphoid cell deficiencies. In addition, they may be used to support the growth and proliferation of erythroid progenitor cells, and to treat various anaemias. They can have colony stimulating factor (CSF) activity and car be used to support the growth and proliferation of myeloid cells such as
                                                                                                                                                                                                                                                                                                                                                                                                                            112

The cDNA was isolated from a Saos-2 (human osteosarcoma cell line) cDNA library. The protein from a Saos-2 (human osteosarcoma cell neuroendocrine-specific protein C (PIR Accession No. 160904), and may have a similar function. The protein may be used to raise specific antibodies, as assay reagents, as diagnostic tissue markers, for the isolation of cognate receptors, ligands and binding proteins, and as biologically active agents. Nucleotides encoding the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transformed with these nucleotides may be used to screen for agonists and antagonists which are potentially useful therapeutically.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, hematopolesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polynucleotides obtained from human fetal kidney, adult lung, adult kidney, adult brain, adult blood, adult testes, and fetal brain and murine adult bone marrow cDNA libraries. The secretd protein nucleic acid sequences (X6801-81) correspond to clones bd306-7, gj283-6, fk317-3, k213-2x, na316-1, nf93-20, np164-1, pe204-1, ya1-1 and yb-1, (all clones are deposited as ATCC 98599); The PNs and proteins are predicted to have biological activities which would make them suitable for treating,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      148
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            179

          HP02061 which encodes a 26 kD protein with two putative transmembr domains. The CDNA was isolated from a Saos-2 (human osteosarcoma c line) cDNA library. The protein has homology with the human neuroendocrine-specific protein C (PIR Accession No. 160904), and may have a similar function. The protein may be used to raise specific antibodies, as assay reagents, as diagnostic tissue markers, for the isolation of cognate receptors,
